

Universal Carbide Meter

BS 812, ASTM D4944, AASHTO T217

DESCRIPTION:

The moisture content can be determined using the Moisture tester based on the calcium carbide method.

The soil sample is introduced in the bottle with the reagent. The water reacts with calcium carbide and develops a gas pressure, which is indicated on the manometer and easily converted in the percentage of moisture.

It is possible to vary the sample weight from 3 to 100g for the complete reaction between the sample and carbide with accurate moisture measurements from 0 to over 20%.

The glass ampoule containing the calcium carbide is broken when the bottle is closed and shaken, granting better accuracy to the test.

The instrument comprises the testing bottle with manometer, small balance, 20 ampoules of reagent, accessories, case.
